

EV AUTO-Enhancer™ Apache Installation.

Comodo EV AUTO-Enhancer™ - Automatic EV Deployment and Maintenance Technology

If you have not already done so, please [download the zip file that matches your order](#).

You will need to replace the bundle file that is in use for the web site with the one downloaded above for EV AUTO-Enhancer™

When deploying EV AUTO-Enhancer™ with Apache, you ****MUST**** use the 'SSLCertificateChainFile' directive instead of the 'SSLCACertificateFile'/'SSLCACertificatePath' directives.

Also, you must do a full restart of Apache for these changes to take effect

NOTE: If you use only SSLCACertificateFile/Path, the green bar will not appear in your customers browser, unless the customers browser already has the new Comodo Root installed.

If your version of Apache does not support 'SSLCertificateChainFile' then you will not be able to use the EV AUTO-Enhancer™ method. Instead, you will need to use the EV Enhancer™ method - see Related Article below.

For Information:

We are aware that Apache 1.3.x with Apache-SSL (<http://www.apache-ssl.org>), aka Ben-SSL (after Ben Laurie the original author), does not support the SSLCertificateChainFile directive in any version.

Apache 1.3.x and Apache 2.x.y with mod_ssl (<http://www.modssl.org>) always support the SSLCertificateChainFile directive.
